RabbitQA

Multi-Agentic AI Platform for Digital Product Quality

AI agents that work with your team, from the business request to production.

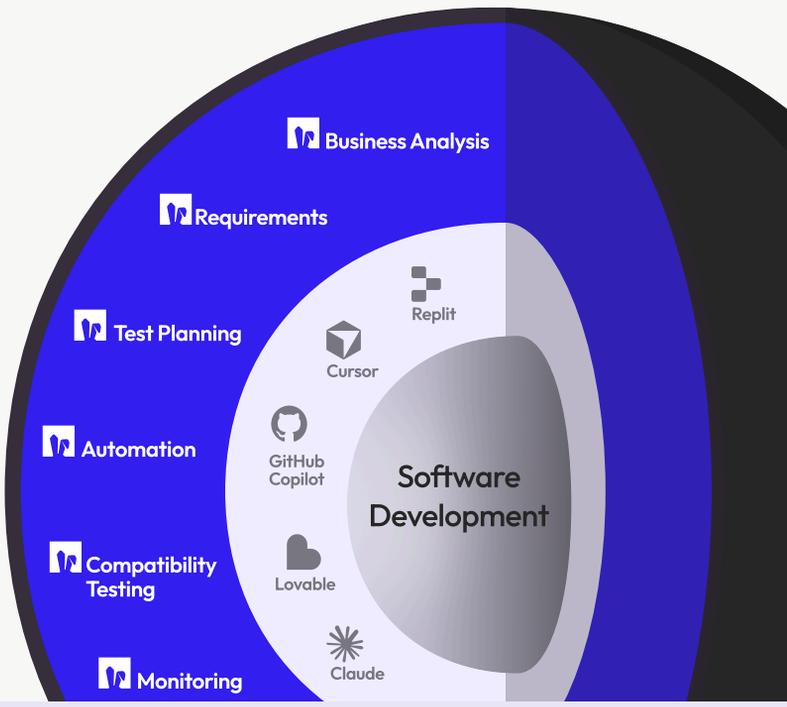

RabbitQA's specialized agents check each business request, automate your web, mobile, smartwatch and API tests, and watch your live systems. Human-in-the-loop by design: every critical decision stays with your team.

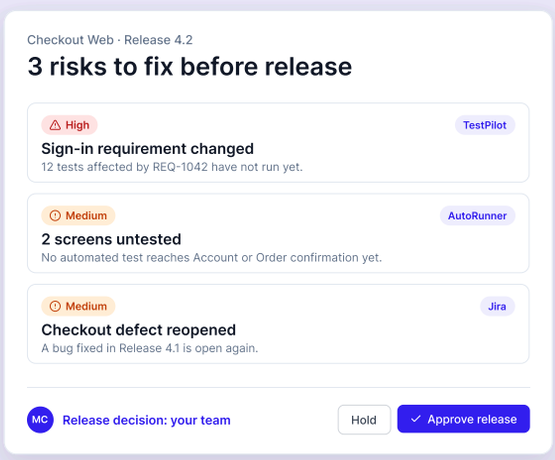

Development got faster. Quality work didn't keep up.

AI coding tools turn business requests into code faster than ever. A clear request becomes a working feature sooner. An unclear one fails in production sooner, and testing at the end can't fix what was unclear from the start.

Code is the core. RabbitQA covers the work around it.

Enterprises can't ship on code alone. Analysis, planning, testing, automation and monitoring have to keep pace, and that is where RabbitQA's agents work, so the whole product reaches the market sooner.

Start where you are.

Begin with your business requests, or connect RabbitQA to the test automation you already run. Your existing tests keep working as they are, and the agents add what is missing: test cases, test data and real-device testing.

Predict Risk

Catch unclear business requests, missing scenarios and untested screens while they are cheap to fix.

Prevent Failure

See which tests are affected when a requirement changes, and run them before release.

Protect Revenue

Watch your live systems after release and fix issues before they cost you customers.

RabbitQA

Agents do the work. Your team decides.

One connected flow in four steps.

1 Get the requirement right

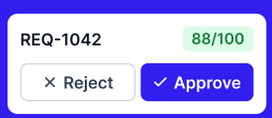

Business Agents

- SmartRequest
- Analyzer
- SmartPBI

SmartRequest asks what a business request is missing, scores it and turns it into a clear requirement. Analyzer scores requirement documents, flags gaps and risks, and recommends how to fix them. SmartPBI turns requirements into epics, features, user stories and acceptance criteria.

YOU DECIDE

Approve the request before work starts.

2 Plan the tests

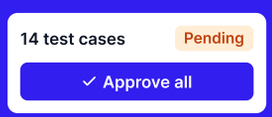

Planning Agents

- CaseWriter
- DataCrate
- TestPilot

CaseWriter writes test cases, including edge cases, and shows which parts of each requirement have no test yet. DataCrate creates synthetic test data, so production data stays out of testing. TestPilot keeps your test cases, test plans and test runs in one place. It shows pass rates and progress for every plan, and which tests are affected when a requirement changes.

YOU DECIDE

Approve the test cases.

3 Run the tests

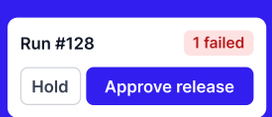

Technical Agents

- SmartAPI
- AutoRunner

SmartAPI turns your API specifications into tests and saves them in AutoRunner, RabbitQA's own AI-native test runner. Import your existing automation into it, or create new tests for web, mobile and smartwatch in natural language, from scratch or from your test cases, including the ones CaseWriter and SmartAPI write.

YOU DECIDE

Review failed tests, then approve or hold the release.

4 Watch after release

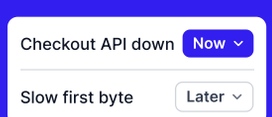

Technical Agents

- HealthCheck

Passing tests are not the finish line. HealthCheck watches your live systems for uptime and compliance readiness, and lists the top issues to fix.

YOU DECIDE

Choose what to fix, and when.

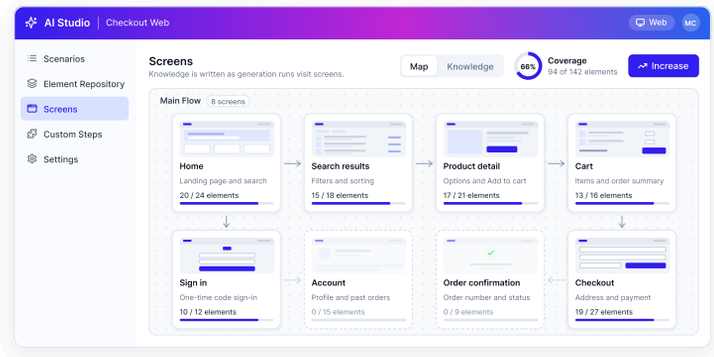

RabbitQA

What makes RabbitQA different

Automation that learns your product

For automation, no need to wait for a stable product: AutoRunner creates tests from natural language and learns your product as it tests. Each run adds the screens and flows it visits to its knowledge base, later runs build on it, and tests stay up to date as screens change. Its coverage map counts the buttons, fields and other elements on every screen and shows what percentage of them your tests cover. Agents also use the terminology and business rules in the documents you share.

Test the journey, not the screen

One scenario can follow a customer from web to mobile to smartwatch. Real-device testing, cross-browser testing and WCAG accessibility checks all run on one platform.

MobileHub · BrowserHub · Accessibility

Responsible AI, built in

Your team signs off, requirement scores show their reasons, and you choose the AI model the agents use, including your own. Role-based access, single sign-on and an audit log keep every action traceable.

Works with the tools you already use

Your Selenium, Playwright and Appium suites run in RabbitQA as they are: no rewrite, no conversion, nothing lost in translation. New tests come from RabbitQA's own AI-native automation, which turns natural-language scenarios into no-code tests. Test runs can start from your CI/CD pipeline, and RabbitQA connects to the tools your teams plan and ship with.

Compatible test frameworks and tools

Selenium · Playwright · Appium · Cucumber · Gauge · Robot Framework · JUnit · TestNG · xUnit · Postman

Planning and delivery tools

Jira · Azure DevOps · Confluence · GitHub · GitLab · Jenkins · Figma

Certified

Flexible deployment
Cloud, hybrid or on-premises

RabbitQA

Built for businesses that cannot afford software failure

Banking & Financial Services

Every release touches money, customers and regulators. RabbitQA keeps requirements, test cases, test runs and approvals in one place, so you can show auditors what was tested and who signed it off.

Insurance

Products and rules change often, and the logic behind them is complex. RabbitQA finds gaps in each specification and writes the edge-case tests those rules need.

Retail & E-commerce

Campaigns and weekly releases leave little room for error. RabbitQA re-tests web and mobile journeys after every change, so checkout is tested before your busiest day, not during it.

Aviation & Travel

A booking passes through reservation, payment and partner systems, and one broken connection stops a passenger at check-in. RabbitQA tests the connections between those systems before each release.

Trusted by industry leaders

Banking	Retail & Telecom	Aviation	Insurance
YapıKredi	A101	SunExpress	Anadolu Sigorta
Akbank AG	hopi	Pegasus	Quick Sigorta
KT Bank	Turkcell	corendon	HDI Sigorta

About RabbitQA

RabbitQA, a multi-agentic AI platform for digital product quality, enables enterprises to predict risk, prevent failure and protect revenue with AI agents that do the quality work from the business request to production. Every critical decision stays with your team. RabbitQA is developed by Virgosol, which has delivered quality engineering for more than 100 organizations since 2019.
